Typical Piping Diagram Configuration

Basic Layout Overview

A typical chilled water buffer tank piping diagram illustrates how the chiller, buffer tank, pumps, and loads are interconnected. The main flow paths include the chilled water supply from the chiller to the buffer tank, then onward to the building loads, and back via the return lines. The buffer tank acts as an intermediary, with piping

configured to optimize flow, temperature control, and system redundancy.

Flow Path Explanation

1. **Chiller Outlet to Buffer Tank:** The cooled water exits the chiller and enters the buffer tank via the supply piping. A control or check valve often regulates flow, preventing backflow and maintaining proper circulation.
2. **Buffer Tank to Load:** From the buffer tank, water flows through distribution piping to various HVAC zones or air handling units (AHUs). Pumps are typically installed to maintain adequate pressure and flow rate.
3. **Return Lines:** After passing through the loads, the warmer water returns via the chilled water return line to the buffer tank, completing the loop.

Incorporating Control Elements

Control valves and sensors monitor temperature and flow, adjusting pump speeds and valve positions to meet system demands. The piping diagram includes these control elements, often depicted with standardized symbols, to illustrate their placement and function within the system.

Design Considerations for Chilled
